# PRACTICAL 3
## ESCALATION SIMULATION (TheHive Case)

- **Escalation Simulation**
- **Incident Details**

| Field | Value |
|---|---|
| Case ID | 001 |
| Title | Unauthorized Access on Server-Y |
| Severity | High |
| Source IP | 192.168.1.200 |
| Technique | MITRE T1078 (Valid Accounts) |
| Status | Escalated to Tier 2 |

**Escalation Summary :**

A high-priority security incident was identified involving unauthorized access to Server-Y at 13:00. The activity originated from IP address 192.168.1.200 and is associated with MITRE ATT&CK technique T1078 (Valid Accounts). Initial analysis indicates suspicious login behavior suggesting potential credential compromise. Immediate actions were taken to isolate the affected server and prevent further unauthorized access. Due to the severity and potential impact, the incident has been escalated from Tier 1 to Tier 2 for detailed investigation. Further analysis is required to determine the extent of compromise and implement remediation measures.

## SITREP (Situation Report)

**Title**
Unauthorized Access on Server-Y

**Summary**
A security incident was detected on Server-Y at 13:00 involving unauthorized access from IP address 192.168.1.200. The activity is associated with MITRE ATT&CK technique T1078 (Valid Accounts), indicating possible misuse of legitimate credentials. The incident was identified through suspicious login behavior and flagged as high priority due to potential system compromise.

**Actions Taken**
The affected server was immediately isolated from the network to prevent further unauthorized access. The incident was escalated to Tier 2 for deeper investigation. Initial containment measures were applied, and logs were preserved for forensic analysis. Further actions will include credential review and system integrity verification.

## WORKFLOW AUTOMATION (Splunk Phantom)

- **Workflow Automation**
- **Description**

A simple automation workflow was designed to handle high-priority security alerts by automatically escalating them to Tier 2 analysts. This reduces response time and ensures critical incidents are handled efficiently.

**Playbook Logic**

IF Alert Priority = High
THEN Assign to Tier 2 Analyst
AND Add Incident Tag = "High Severity"
AND Notify SOC Team

**Simulated Execution**

| Alert ID | Priority | Action Taken | Assigned To |
|---|---|---|---|
| 005 | High | Auto-escalated | Tier 2 SOC |
| 006 | Medium | No escalation required | Tier 1 SOC |

**Interpretation**

The automation workflow ensures that high-priority alerts are immediately escalated to Tier 2 without manual intervention. This improves incident response time and reduces the risk of delayed investigation for critical security events.
